

In Lab Tasks

A network administrator needs to quickly identify the IP address assigned to a computer before configuring it on the university network.

Requirements:

1. Retrieve the computer's hostname.
 2. Use the hostname to determine its IP address.
 3. Display both hostname and IP address
-

A university server provides a greeting service to students.

Requirements:

1. Client connects to the server.
2. Client sends the student's name.
3. Server receives the name.
4. Server responds with a personalized greeting.
5. Client displays the greeting.

Example:

Client: Ali

Server: *Welcome Ali! You are connected to the university server.*

Two students want to communicate through a simple client-server chat application.

Requirements:

1. Establish a TCP connection.
 2. Client sends a message.
 3. Server receives and displays it.
 4. Server sends a reply.
 5. Client displays the reply.
 6. Continue communication until "bye" is entered.
